

## Lecture 5:

### More Newton...

- ★ Newton's Universal Law of Gravity
- ★ Acceleration in circular orbits
- ★ Weak equivalence principle
- ★ Kepler's laws from Newtonian gravity
- ★ The power of Newton's laws

### ...how old is the Earth?

- ★ Hints from biology & geology
- ★ Radioactive dating

### Reference frames and some puzzles...

- ★ Real and fictitious forces

9/10/18

## RECAP

- ★ **Newton's 1<sup>st</sup> law** -  $V = \text{constant}$  if  $F = 0$
- ★ **Newton's 2<sup>nd</sup> law** -  $F = Ma$
- ★ **Newton's 3<sup>rd</sup> law** - for every action there is an equal and opposite reaction.
- ★ **Galilean Transformation** - the “usual” velocity addition/subtraction rule for changing frames of reference.
- ★ **Galilean Relativity** - the idea that the laws of nature are the same for a moving observer as for a stationary observer.

9/10/18

## II: NEWTON'S LAW OF UNIVERSAL GRAVITATION

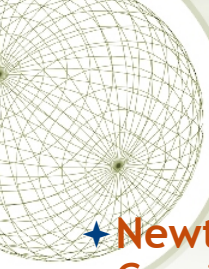

Newton's law of Gravitation: A particle with mass  $m_1$  will attract another particle with mass  $m_2$  and distance  $r$  with a force  $F$  given by

$$F = \frac{Gm_1m_2}{r^2}$$

- “G” is called the Gravitational constant ( $G = 6.67 \times 10^{-11} \text{ N m}^2 \text{ kg}^{-2}$  in mks units)
- This is a **universal** attraction. Every particle in the universe attracts every other particle! Gravity often dominates in astronomical settings.

9/10/18

6

## Newton's law of gravity

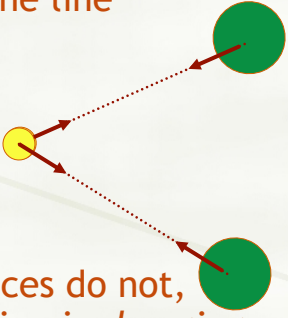

- ★ **Newton's law of gravity** - Gravitational force between two particles with gravitational masses  $M_1$  and  $M_2$  separated by distance  $r$  is:
 
$$F = \frac{Gm_1m_2}{r^2}$$
- ★ **Direction of gravity** is along the line connecting the two masses

9/10/18 7

- ★ **Magnitude of gravitational force** between masses  $M_1$  and  $M_2$  separated by distance  $r$  is:
 
$$F = \frac{Gm_1m_2}{r^2}$$
- ★ **Direction of gravity** is along the line connecting the two masses

- ★ If positions change but distances do not, *force changes because direction is changing*

9/10/18 8

## Speed and velocity

- ★ Velocity, as used in Newton's laws, includes both a speed and a direction.  $\mathbf{v}$  and also  $\mathbf{F}$  and  $\mathbf{a}$  are vectors.
- ★ Any change in direction, even if the speed is constant, requires a force
- ★ In particular, motion at constant speed in a circle must involve a force at all times, since the direction is always changing

9/10/18

9

## Speed and velocity

- ★ Velocity, as used in Newton's laws, includes both a speed and a direction.  $\mathbf{v}$  and also  $\mathbf{F}$  and  $\mathbf{a}$  are vectors.
- ★ Any change in direction, even if the speed is constant, requires a force
- ★ In particular, motion at constant speed in a circle must involve a force at all times, since the direction is always changing

9/10/18

10

## Acceleration in a circular trajectory

The diagram illustrates the change in velocity  $\Delta \mathbf{v}$  for a particle moving in a circle of radius  $R$ . At two different positions, the velocity vectors  $\mathbf{v}_1$  and  $\mathbf{v}_2$  are shown as tangents to the circle. The angle between the radii to these positions is  $\Delta \phi$ . A vector diagram shows  $\mathbf{v}_2$  and  $-\mathbf{v}_1$  being added to find  $\Delta \mathbf{v}$ .

$\Delta \mathbf{v} = \mathbf{v}_2 + (-\mathbf{v}_1)$

9/10/18 11

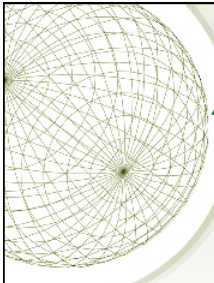

## Acceleration in a circular trajectory

The diagram illustrates the change in velocity  $\Delta \mathbf{v}$  for a particle moving in a circle of radius  $R$ . At two different positions, the velocity vectors  $\mathbf{v}_1$  and  $\mathbf{v}_2$  are shown as tangents to the circle. The angle between the radii to these positions is  $\Delta \phi$ . A vector diagram shows  $\mathbf{v}_2$  and  $-\mathbf{v}_1$  being added to find  $\Delta \mathbf{v}$ .

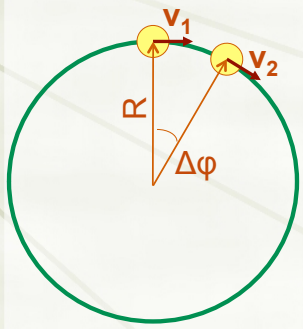

$\Delta \mathbf{v} = \mathbf{v}_2 + (-\mathbf{v}_1)$

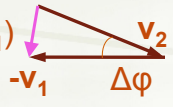

For small  $\phi$ ,  $\Delta v \approx v \Delta \phi$

9/10/18 12

## Acceleration in a circular trajectory

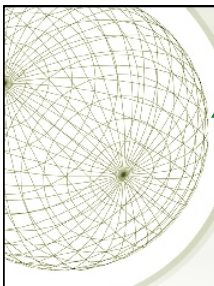

$$\Delta \mathbf{v} = \mathbf{v}_2 + (-\mathbf{v}_1)$$

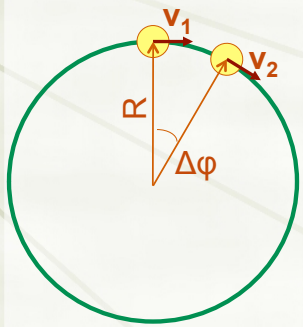

For small  $\phi$ ,  $\Delta v \approx v \Delta \phi$

For constant speed  $v$ , the time it takes to go around is  
 $T = \text{perimeter}/v = 2\pi R/v$

9/10/1813

## Acceleration in a circular trajectory

$$\Delta \mathbf{v} = \mathbf{v}_2 + (-\mathbf{v}_1)$$

For small  $\phi$ ,  $\Delta v \approx v \Delta \phi$

For constant speed  $v$ , the time it takes to go around is  
 $T = \text{perimeter}/v = 2\pi R/v$

$\Delta \phi = \Delta t \cdot 2\pi/T = \Delta t \cdot v/R$

9/10/1814

## Acceleration in a circular trajectory

$\Delta \mathbf{v} = \mathbf{v}_2 + (-\mathbf{v}_1)$

For small  $\phi$ ,  $\Delta v \approx v \Delta \phi$

For constant speed  $v$ , the time it takes to go around is

$T = \text{perimeter}/v = 2\pi R/v$

$\Delta \phi = \Delta t \cdot 2\pi/T = \Delta t \cdot v/R$

So  $\Delta v/\Delta t = v \Delta \phi/\Delta t = v^2/R$

9/10/18 15

## Acceleration in a circular trajectory

$\Delta \mathbf{v} = \mathbf{v}_2 + (-\mathbf{v}_1)$

For small  $\phi$ ,  $\Delta v \approx v \Delta \phi$

For constant speed  $v$ , the time it takes to go around is

$T = \text{perimeter}/v = 2\pi R/v$

$\Delta \phi = \Delta t \cdot 2\pi/T = \Delta t \cdot v/R$

So  $\Delta v/\Delta t = v \Delta \phi/\Delta t = v^2/R$

$a = \Delta v/\Delta t = v^2/R$

9/10/18 16

## “Falling” in a circular orbit

- Newton arrived at the theory of gravity by imagining that the same force causes an apple to fall towards the Earth as the Moon to orbit Earth (continually “falling”), with a decrease in the magnitude of the force with distance
- In what sense is a body in orbit “falling”?
- *Direction of acceleration* (= rate of change of vector velocity) is always *directly towards center of orbit*
- *Acceleration* must be toward center because *gravitational force* is toward center, and  $F=ma$  is a vector equation

## More on gravity

- Newton’s Law of Gravitation defines the “gravitational mass” of a body
- Using calculus, it can be shown that a spherical object with mass  $M$  (e.g. Sun, Earth) creates the same gravity as a particle of the same mass  $M$  at the sphere’s center.

## Inertial and gravitational mass: the weak equivalence principle

Newton's 2<sup>nd</sup> law says:

$m_I$ =inertial mass

Newton's law of gravitation says:

$m_G$ =gravitational mass

So, acceleration due to gravity is:

$$a = \left( \frac{m_G}{m_I} \right) \frac{GM}{r^2}$$

So, if the ratio ( $m_G/m_I$ ) varies, the rate at which objects fall in a gravitational field will vary...

9/10/18

19

At the end of the last Apollo 15 moon walk (July 1971), Commander David Scott performed a live test of  $m_I/m_G$  for the television cameras.

9/10/18

20

## Equivalence of inertial and gravitational mass

- ✦ Experimentally, if all forces apart from gravity can be ignored, all objects fall at the same rate (first demonstrated by Galileo)
- ✦ So,  $m_I/m_G$  must be the same for all bodies
- ✦ And we can choose the constant “G” such that  $m_I = m_G$ , and  $a = GM/r^2$
- ✦ This is the **weak equivalence principle**: gravity is equivalent to (indistinguishable from) any other acceleration.

9/10/18

21

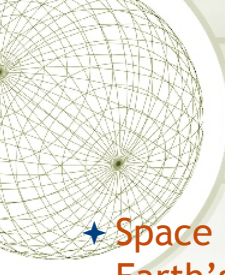

## “Weightlessness”

9/10/18

Apollo 10, in orbit (May 18-26, 1969)

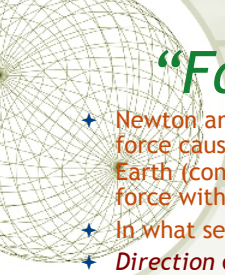

22

## No weight, or free-fall?

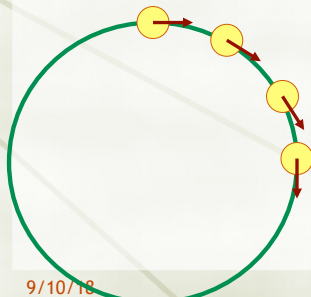

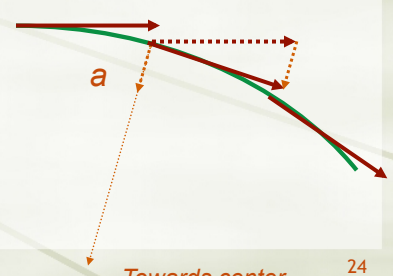

- ★ Space Station orbits about 500km above Earth's surface. Radius of Earth is 6300km.
- ★ Newton's inverse square law:
  - ✦ Gravitational acceleration at location of space station is 86% of what it is on the Earth's surface!
- ★ So, why do the astronauts feel weightless?
  - ✦ The astronauts "fall" toward Earth at the same rate as the space station - another example of the equivalence principle.

9/10/18 23

## "Falling" in a circular orbit

- ★ Newton arrived at the theory of gravity by imagining that the same force causes an apple to fall towards the Earth as the Moon to orbit Earth (continually "falling"), with a decrease in the magnitude of the force with distance
- ★ In what sense is a body in orbit "falling"?
- ★ *Direction* of acceleration (= rate of change of vector velocity) is always *directly towards center of orbit*
- ★ *Acceleration* must be toward center because *gravitational force* is toward center, and  $F=ma$  is a vector equation

26

## Kepler's laws explained!

- ★ Kepler's laws of planetary motion
  - ★ Can be derived from Newton's laws
  - ★ Just need to assume that planets are attracted to the Sun by gravity (Newton's breakthrough).
  - ★ Full proof requires calculus (or very involved geometry)

9/10/18

27

- ★ If there were no gravity from Sun, a planet's natural state is to move in a straight line at constant velocity
- ★ But, gravitational attraction by Sun is always making it swerve off course
- ★ We're not going to prove this, but...
  - ★ Newton's gravity law ( $1/R^2$ ) is exactly what's needed to make this path be a perfect ellipse - hence Kepler's 1<sup>st</sup> law.
  - ★ The fact that the force is always directed towards Sun gives Kepler's 2<sup>nd</sup> law (equal areas in equal times  $\Leftrightarrow$  conservation of angular momentum).  
*Note: Kepler's 2nd law would be true for any "central" force, not just a  $1/R^2$  law*
  - ★ Newton's 2<sup>nd</sup> law ( $F = ma$ ) combined with his gravity law gives Kepler's 3<sup>rd</sup> law -- the relation between orbit period and semimajor axis

$$P^2 = \frac{4\pi^2}{GM_{sun}} R^3$$

9/10/18

28

## Applications and impact of Newtonian physics

- ✦ With Newton's laws, it was possible to make new predictions about orbits of solar system bodies
  - ✦ Halley argued that several comet appearances separated by 76 years were actually the same comet, and predicted its recurrence in 1758
  - ✦ Planets have near-elliptical orbits, but they are not exact ellipses due to gravity of *other* planets
  - ✦ Herschel, in 1781, discovered Uranus; its orbit showed enough variations to predict there must be another as-yet-unknown planet, leading to discovery of Neptune in 1846
- ✦ Newton's laws can be applied to stars in galaxies, galaxies in clusters, etc., to understand orbits and "weigh" the system, since the mass is proportional to the inverse-square of the typical orbital period and cube of the orbital distance.
- ✦ As Newton's physics came to be widely known, there was a huge cultural impact. With the Universe describable by precise mathematical laws, it supported the idea of "rationality" in other arenas -- including architecture, government, history, etc. Key to shift in thought known as the Enlightenment. The universe is a giant machine! (?)

The universe is a giant machine! (?)

9/10/18

31

## The time domain

- ★ With Copernicus, Kepler, Galileo, and Newton, ideas of the vast magnitude of space beyond Earth opened up
- ★ What about *time*?
  - ★ From ~1700-1850, the idea took hold that Earth was very old
  - ★ Important was the realization that strata of rock take their observed physical form due to weathering, volcanism, etc, acting over very long periods (Charles Lyell: Uniformitarianism)
  - ★ Also important in appreciation of ancient earth was finding progressions of **fossils** of (often extinct) creatures in successive layers of rock
  - ★ Physical progression in fossil features (invertebrates, fish, mammals) implied a biological transformation, presumed to be in response to environmental changes.
  - ★ Charles Darwin (1859) published *The Origin of Species* to argue that evolution proceeds via natural selection. Much time would be required, since species are observed to change slowly. Darwin estimated at least 300 million years based on geological evidence.

9/10/18

32

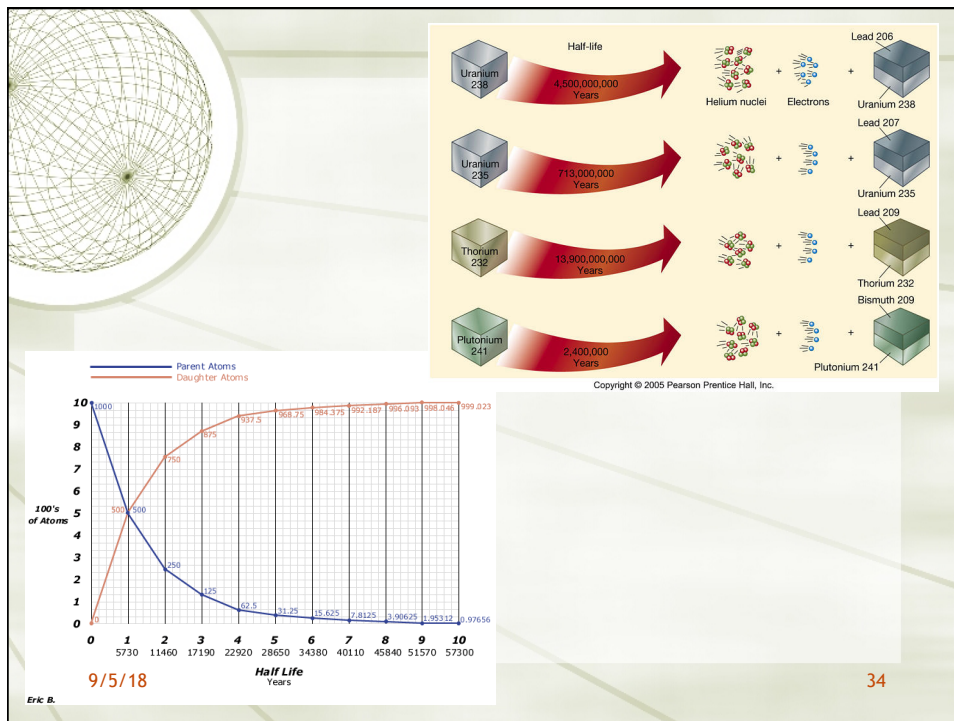

## “Red herrings” from physics, and a resolution

- ★ In 1840-50’s physicists Kelvin and Helmholtz argued that the only possible way for the Sun to power itself was by gravitational contraction
- ★ Comparing the rate energy is produced by the Sun (total observed luminosity) to the available gravitational energy, an age of 30 million years for the Sun was estimated
- ★ Thus astronomical and geological/biological ideas were in conflict until the early 20th century
- ★ With development of nuclear physics in early 1900’s, it was understood what was wrong with the Kelvin-Helmholtz argument: Sun’s energy source is *fusion, not gravity*
- ★ Starting in 1920’s radioactive dating became possible
- ★ Ages of meteorites, etc., establishes that the formation of the Solar system occurred about 4.6 billion years ago. Humans, 250,000 years (0.25 Myr); dinosaurs 100 Myr.

9/5/18

33

9/5/18

34

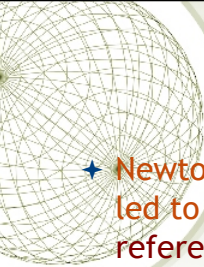

## Radioactive dating

- ★ Radioactive decay transforms one element into another, with a characteristic half-life
  - ★ It is not affected by the physical conditions, although there are temperature considerations that depend on the mineral
- ★ Age equation:  $t = T_{1/2} \log(1 + (D - D_0)/P) / \log 2$ 
  - ★ D is the number of stable “daughter” atoms now ( $D_0$  in original composition)
  - ★ P is the number of radioactive “parent” atoms now
  - ★  $T_{1/2}$  is the half-life (time that takes to convert P/2 atoms into D/2 atoms)
- ★ Reactions useful for planetary radioactive dating:
  - ★  $^{238}\text{U} \rightarrow ^{206}\text{Pb}$  ( $T_{1/2} = 4.47$  billion years)
  - ★  $^{235}\text{U} \rightarrow ^{207}\text{Pb}$  ( $T_{1/2} = 704$  million years)

9/5/18

35

## Inertial and non-inertial frames of reference

- ★ Newton’s laws were clearly powerful. But they also led to some puzzles, particularly relating to reference frames.
- ★ We have already come across idea of frames of reference that move with constant velocity. In such frames, Newton’s laws (esp. N1) hold. These are called **inertial frames of reference**.
- ★ Suppose you are in an accelerating car looking at a freely moving object (i.e., one with no forces acting on it). You will see its velocity changing because you are accelerating! *In accelerating frames of reference, N1 doesn’t hold* - this is a **non-inertial frame of reference**.

9/5/18

36

## *Real and fictitious forces*

- ★ In non-inertial frames you might be fooled into thinking that there were forces acting on free bodies.
- ★ Such forces are call “fictitious forces”.  
Examples -
  - ✦ G-forces in an accelerating vehicle.
  - ✦ Centrifugal forces in amusement park rides.
  - ✦ The Coriolis force on the Earth.
- ★ Fictitious forces point opposite to the direction of acceleration
- ★ Fictitious forces are always proportional to the inertial mass of the body.

9/5/18 37

## *Next time...*

- ★ Principles of space and time
- ★ *HW #1 is due next Thursday*
- ★ *Start reading Ch. 6 for next week*
