

Gas, ISM properties, and Star
Formation in Galaxies: connecting
the Nearby and the Distant Universe

Prof. Alberto Bolatto

Motivation: understanding structure formation

*V. Springel et al.,
Millenium Simulation*

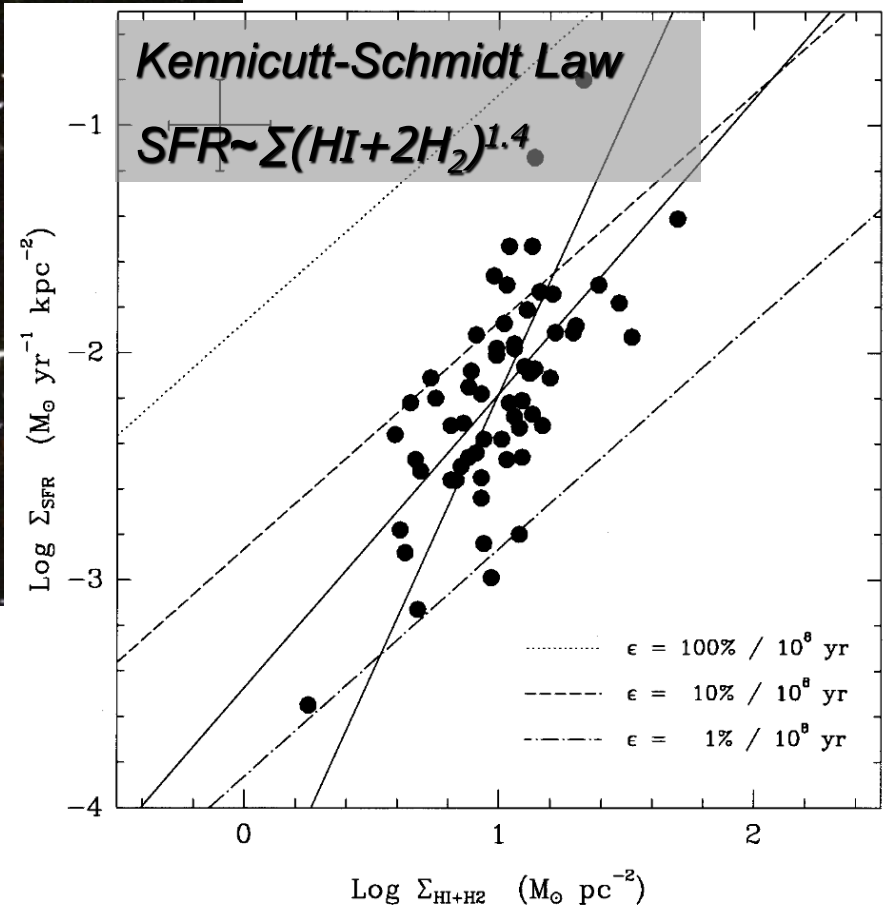

Dark matter (gravity)

Structure formation in the Universe: Light

Hubble UDF

Kennicutt (1989, 1998)

*Dark matter (gravity) → HI → H₂
→ stars → observable structure
(astrophysics)*

The evolution of structure in the universe

Stars form in Giant Molecular Clouds (GMCs)

Molecular transitions are necessary to radiate the heat of contraction

HI is the dominant gas reservoir in galaxies, but star formation occurs only in H_2

Total gas or molecular gas?

S³MC+SMC-SAGE

Spitzer 24, 70, 160 μm
imaging

Bolatto et al. (2007), Gordon et al.
in prep.

▪ Better

▪ We use

(Israel 1997, Dame et al. 2001)

▪ Bypass the CO and Xco using dust as the H₂ tracer

Leroy, Bolatto, et al. (2007, 2009,2010); Bolatto, Leroy, et al. in prep.

Mapping H₂ without CO

Self consistently estimated using HI-dominated lines of sight

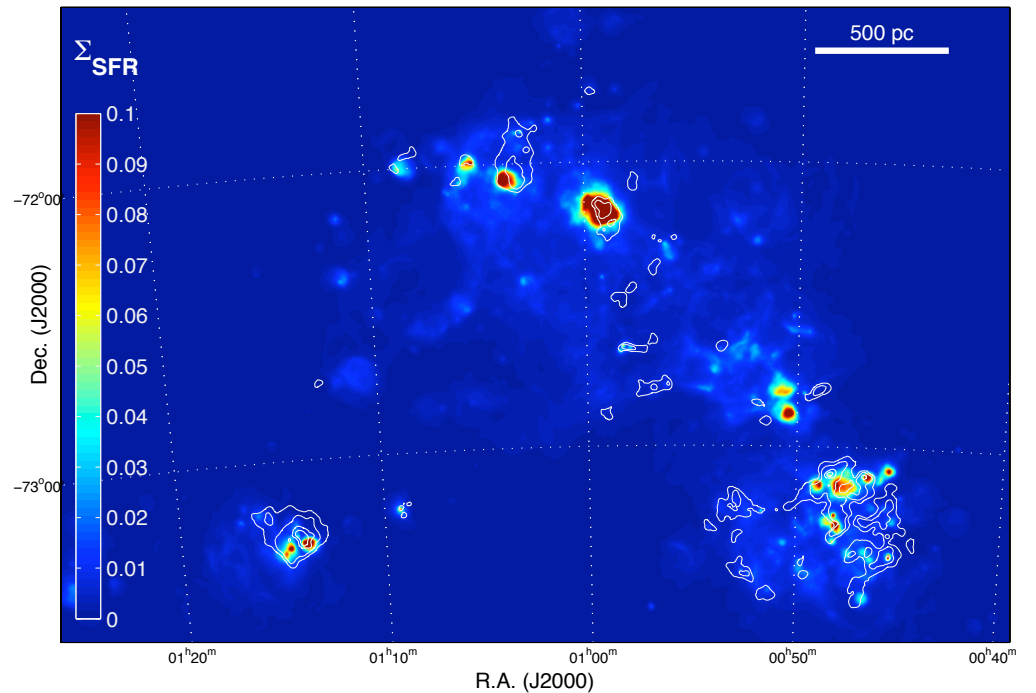

$$\Sigma_{\text{H}_2} = (\Sigma_{\text{dust}} \times \text{GDR}) - \Sigma_{\text{HI}}$$

From FIR SED modeling

From 21 cm mapping

The SMC is dominated by “dark” molecular gas

Israel 1997; Dame et al. 2001; Leroy et al. 2007,2009,2011

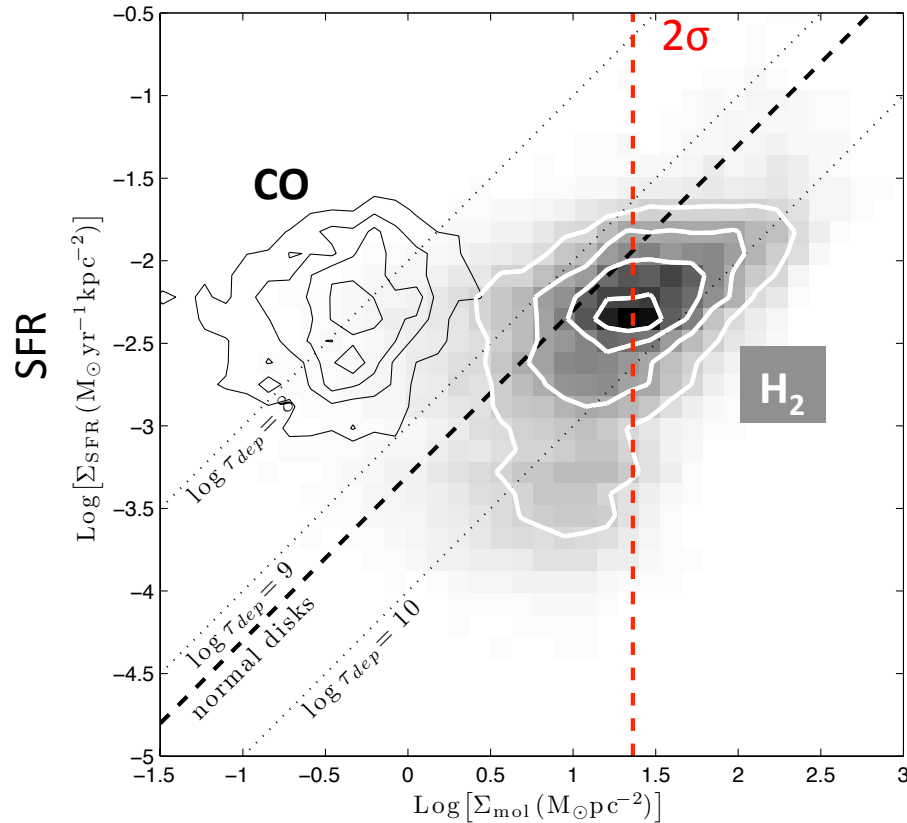

Relations for H₂ and total gas

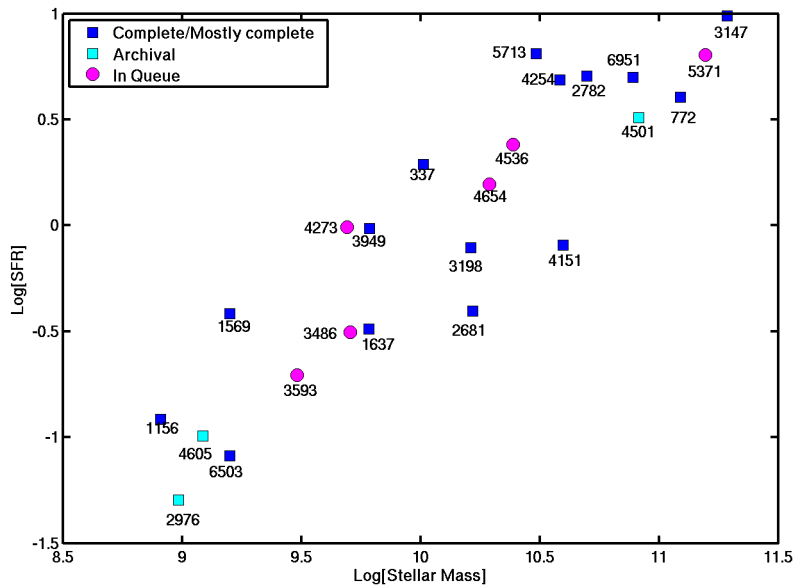

Molecular Gas

Atomic+Molecular Gas

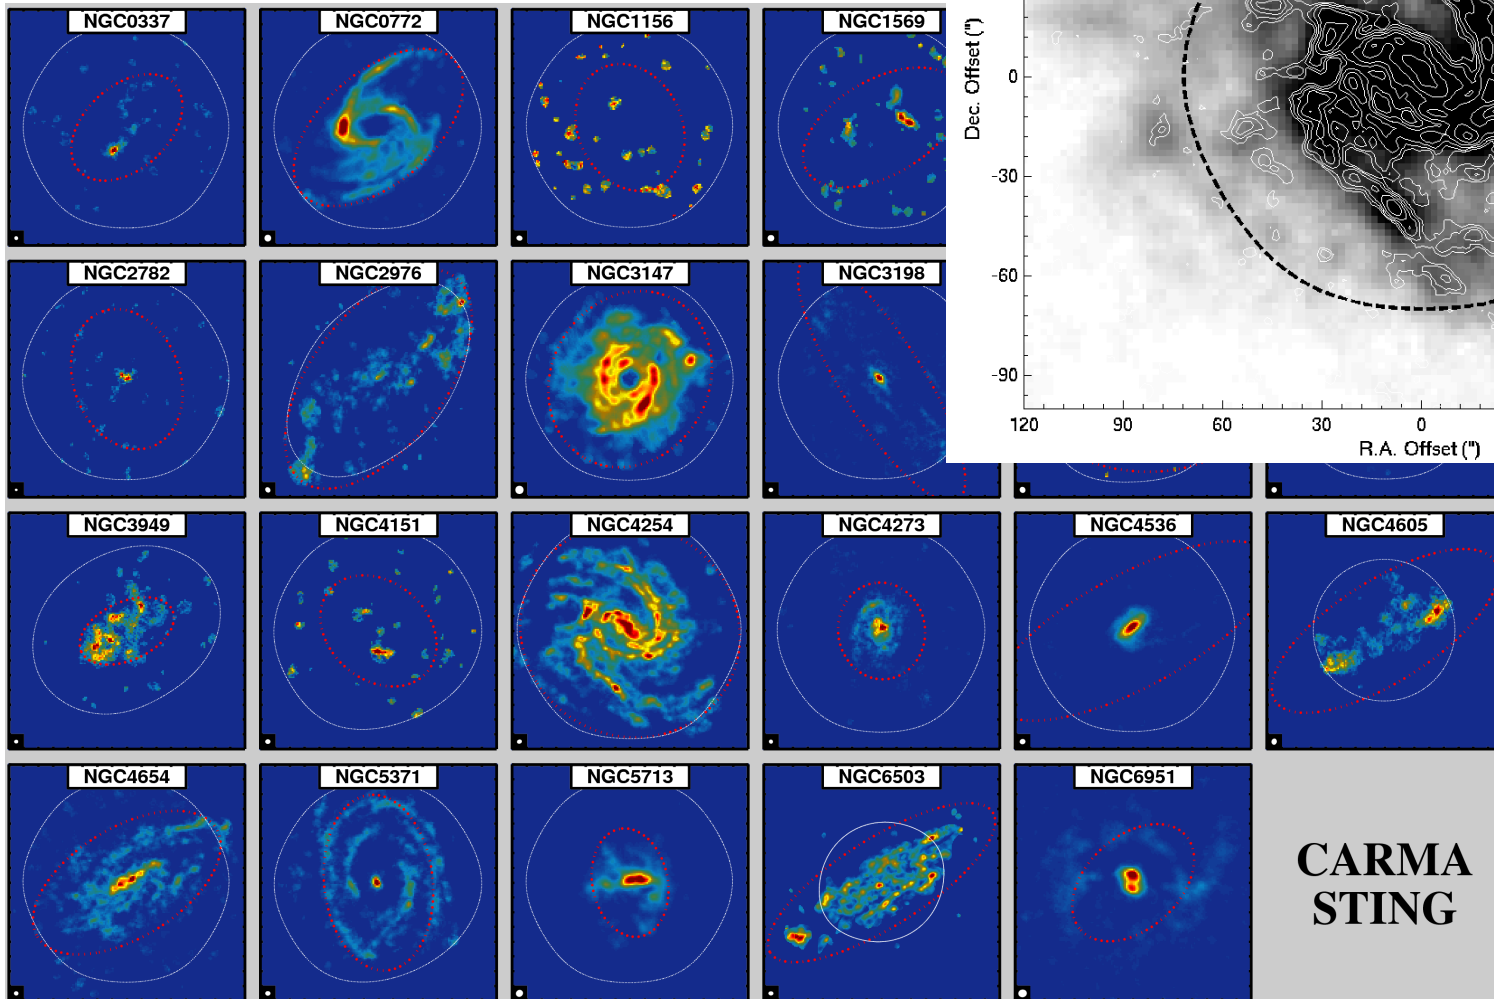

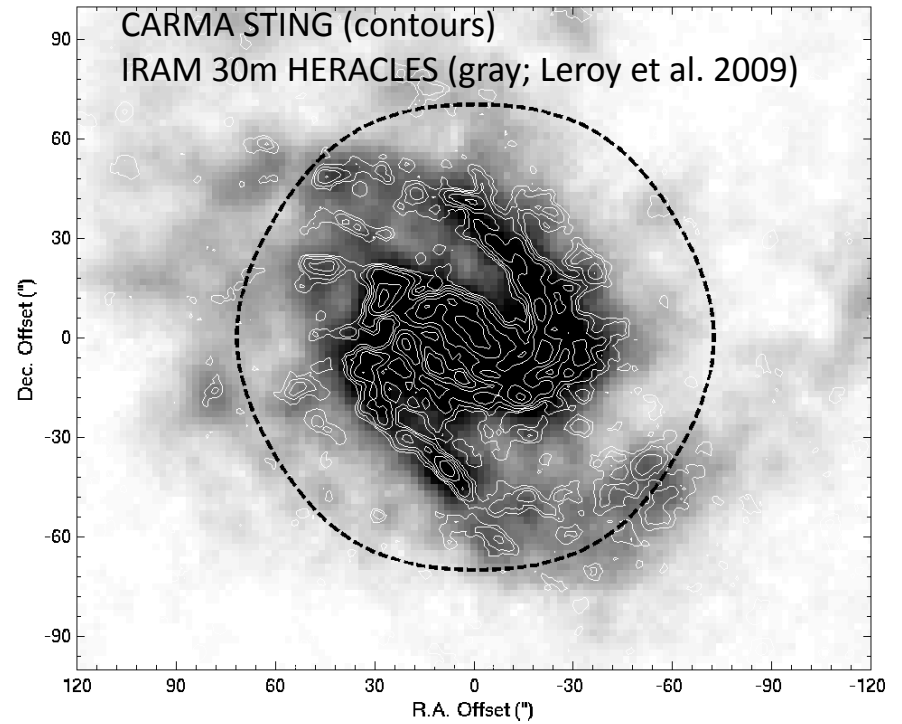

- The SMC is “normal” in H₂ vs. SFR
- The SMC is vastly underperforming in total gas vs. SFR (explains Wolfe & Chen 2006)
- KMT09 models where HI → H₂ → SFR fit the data reasonably well

Molecular Gas in the Blue Sequence

STING

**CARMA
STING**

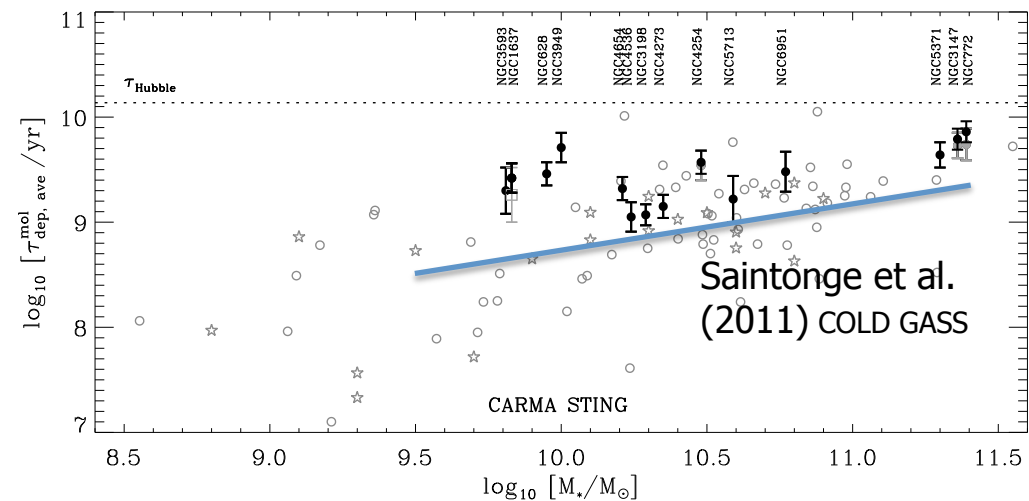

What is the
relation between
gas and SFR?

(Rahman, Bolatto, Wong,
Leroy, Rosolowsky, Blitz,
et al. 2010)

The SLF throughout the blue sequence

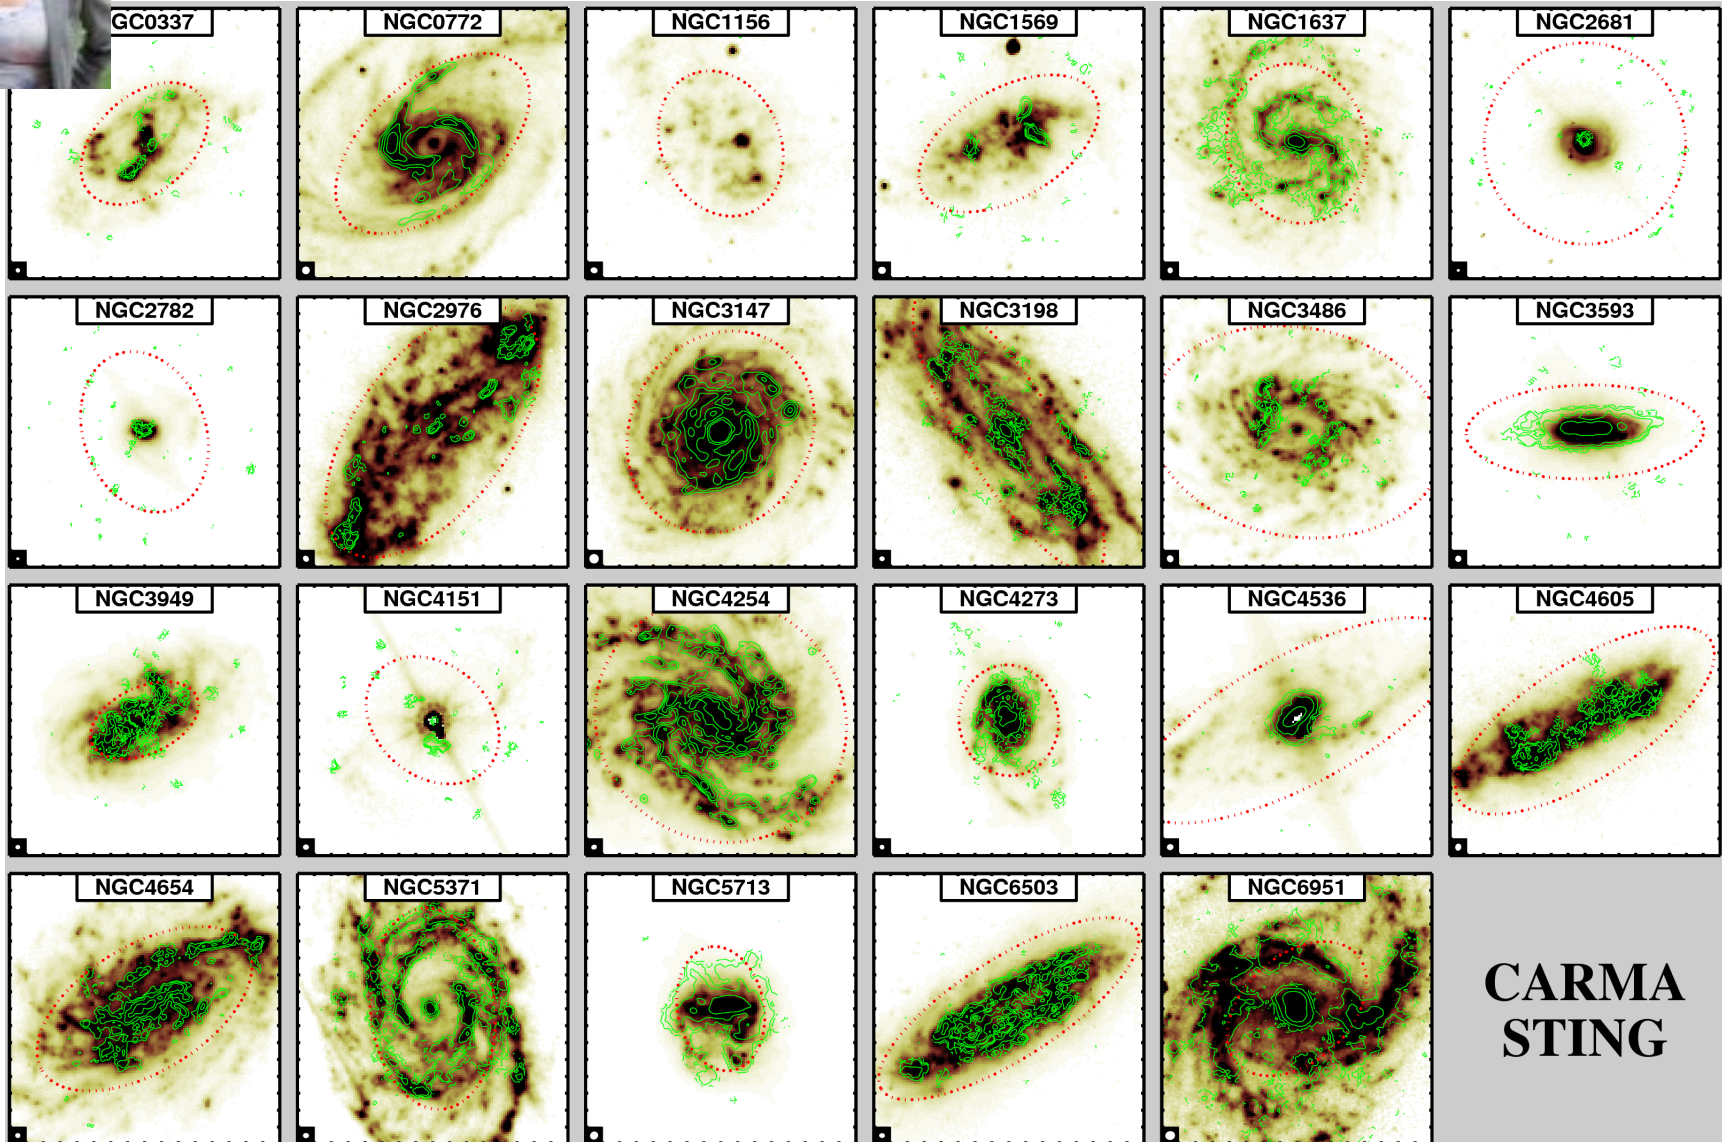

- The resolved relation between SFR and H_2 is approximately linear and independent of galaxy mass
- A molecular depletion time $\tau_{\text{dep}} \sim 2$ Gyr is good for the entire galaxy mass range surveyed
- Uptick at high M_* ?
- Note difference with unresolved measurements

Rahman et al. (2011)

Relation between CO and mid-IR, particularly PAHs

SFRs at high-z

CII

NGC 3521

- Composite from 20 KINGFISH galaxies
- [CII] and 24 μm have almost precisely the predicted relation assuming
 - continuous SFR
 - 20 Myr or older population
 - 3% photoelectric heating efficiency
- Failures? PAH charge? Link to dust properties

NII
122 μ m

NGC 3521

Ionizing Luminosity

McKee & Williams 1997

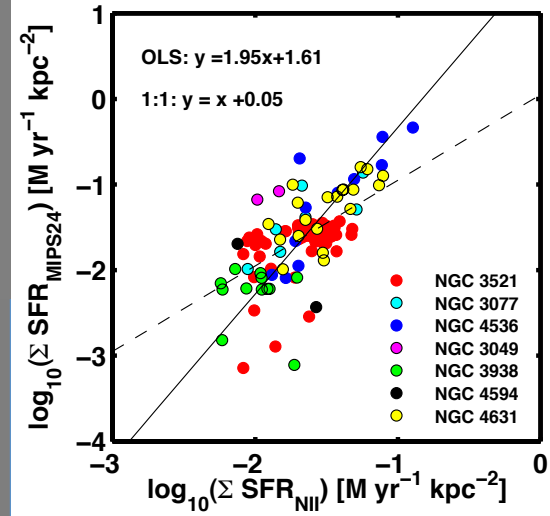

$$S'_T = \alpha_H^{(2)} \left(\frac{L_{122 \mu m}}{h\nu_{122 \mu m} q_{122 \mu m} [N^+]/[H^+]} \right)$$

$q_{122\mu m}$: excitation rate for the 122 μ m line

$$q_{122\mu m} = 3.89e-8 \text{ for } T = 7000K$$

$$[N^+]/[H^+] = [N]/[H] = 6.9e-5$$

$$\alpha_H^{(2)} = 3.57e-13$$

Heating efficiencies at low metallicity

- PAHs are smaller and more neutral at low metallicity!

- Enhanced photoelectric heating? (Israel et al. 2011)

Sandstrom, Bolatto, et al. (2011)

Resolving GMCs in ULIRGs?

Arp 193: CO 2-1 at 0.15" (Zauderer, Bolatto, et al., in prep.)

- Using atmospheric phase correction CARMA can reach 0.15" resolution at 1.3 mm (2km baselines)

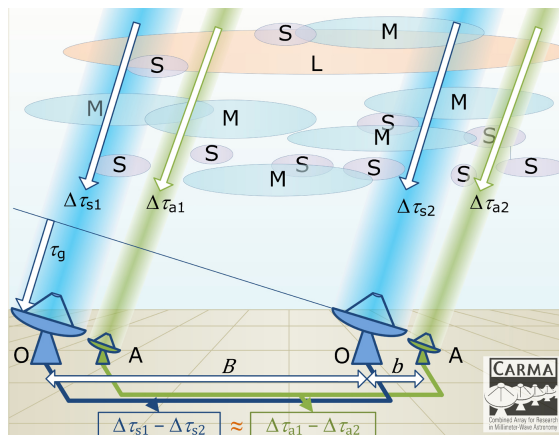

- That is 70 pc at 100 Mpc!!!

- GMCs are 20-50 pc in size for the MW. We are not that far from resolving them.

- $\Sigma_{\text{H}_2} \sim 5,000 \text{ Mo/pc}^2$

- ALMA will be able to pin down GMC properties across a range of galaxy types

- ALMA cycle0 time for GMC properties in NGC253!

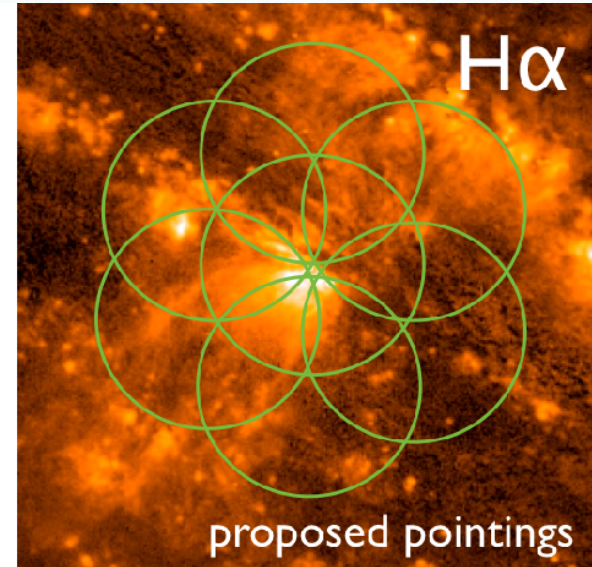

NGC 253: optical

HST ACS

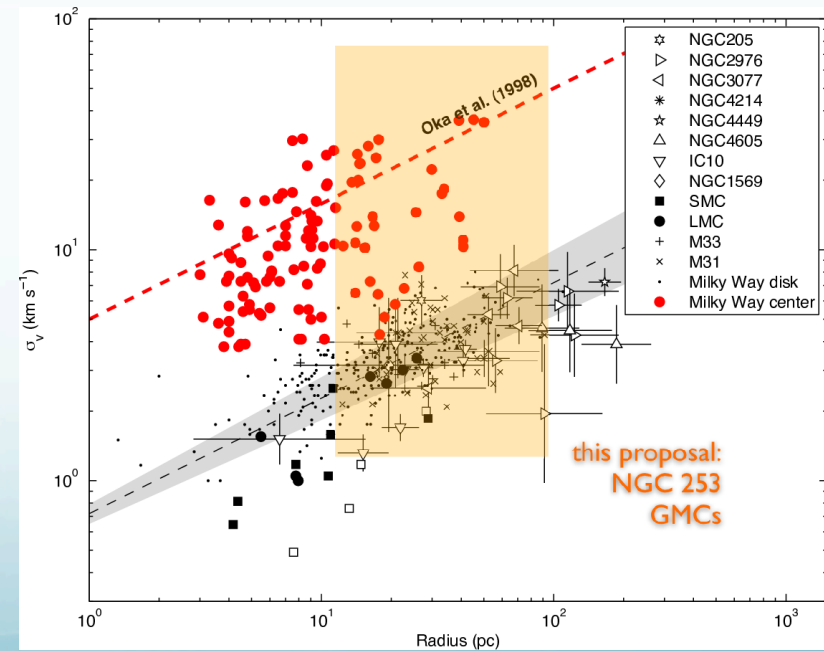

H α

proposed pointings

- Study of the central starburst in NGC253
 - GMC properties: are GMCs different?
 - Origin of the wind

Opportunities for students

- CARMA STING (Nearby Galaxies)
 - Star formation law (PI)
- KINGFISH (Nearby Galaxies)
 - FIR spectroscopy and imaging
 - Submm spectroscopy
- HERITAGE (Magellanic Cloud science)
 - FIR spectroscopy for SMC submitted (PI)
- IRAM LP ($z \sim 1-2$ Medium Redshift)
 - EVLA program (PI)
- ALMA!
 - PI in cycle 0 project: the center of NGC 253
 - Cycle 1 call in March
 - ISM physics at $z=6.4$? Follow up of GRB hosts?
 - Partnership with PUC
