The trial was conducted in two stages. During the initial stage, ten guinea pigs were challenged ocularly. Five of the guinea pigs were then rechallenged, also ocularly, in the second stage.

**Discussion of Results**

A follow-up study to verify the results of this study is underway. The trial will hopefully help determine the different levels of immune response seen in the same animal. The repeat will help us understand the different levels of immune response seen in the same animal.

**Future Research**

The repeat will help us understand the different levels of immune response seen in the same animal. The results will help us understand the different levels of immune response seen in the same animal.
