## II.H. Completed Creative Works

### II.H.8. Software and Applications

- Developed `xa`, X11 software for viewing and animating images in a variety of formats. Released to the public domain in 1993, last update 1996. The code is archived in a variety of X11 public contribution repositories.
- Developed `box.tree`, a gravity simulation tree code with support for sliding patches, released to the public domain in 1994. No longer supported. Most papers prior to Richardson *et al.* 2000 feature this code.
- Modified `pkdgrav`, a high-performance parallel tree code under continuous development, but not presently in the public domain, originally developed by the *N*-body Shop at the University of Washington. Modifications include code for handling particle collisions, sliding patches, external potentials, hard surfaces, rigid body dynamics, and granular dynamics. Most papers from Richardson *et al.* 2000 onward feature this code.
- Developed `ss_core` (now subsumed in a revised version of `pkdgrav` hosted on `github`), a suite of code for supporting `pkdgrav` solar system simulations, including initial conditions generators, analysis software, plotting scripts, visualization tools, and animation support. This package is under continuous development and is used by a variety of collaborators.
