

# Strong gravity and accreting black holes

- The AGN Zoo
  - AGN Unification
- Black Hole systems
  - The spectrum of accreting black holes

1

## AGN- Alias Active Galactic Nuclei

- AGN are 'radiating' supermassive black holes-
  - They go by a large number of names (Seyfert I, Seyfert II, radio galaxies, quasars, Blazars etc etc)
  - The names convey the observational aspects of the objects in the first wavelength band in which they were studied and thus do carry some information
- See [http://nedwww.ipac.caltech.edu/level5/Cambridge/Cambridge\\_contents.html](http://nedwww.ipac.caltech.edu/level5/Cambridge/Cambridge_contents.html) for an overview

*Urry and Padovani 1995*

2

# AGN in Longair- chapters 18,19,20,21

- **18 Active galaxies** 585
- 18.1 Introduction
- 18.2 Radio galaxies and high energy astrophysics
- 18.3 The quasars
- 18.4 Seyfert galaxies
- 18.5 Blazars, superluminal sources and  $\gamma$ -ray sources
- 18.8 X-ray surveys of active galaxies
- 18.9 Unification schemes for active galaxies
- **19 Black holes in the nuclei of galaxies**
- 19.1 The properties of black holes
- 19.2 Elementary considerations
- 19.3 Dynamical evidence for supermassive black holes in galactic nuclei
- 19.5 Black holes and spheroid masses
- 19.6 X-ray observations of fluorescence lines in active galactic nuclei
- 19.7 The growth of black holes in the nuclei of galaxies
- **20 The vicinity of the black hole**
- 20.1 The prime ingredients of active galactic nuclei
- 20.2 The continuum spectrum
- 20.3 The emission line regions – the overall picture
- 20.5 The broad-line regions and reverberation mapping
- 20.7 Accretion discs about supermassive black holes
- **21 Extragalactic radio sources**
- 21.5 Jet physics

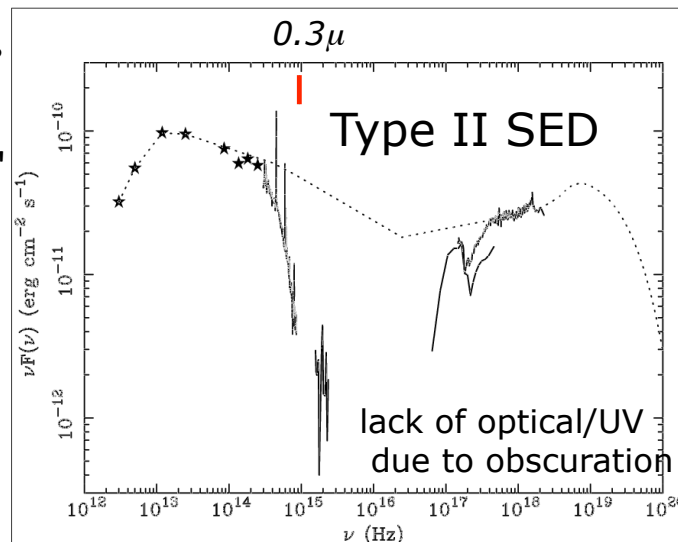

I am covering only a fraction of this material ! (Notice that I have left some sections out entirely)

## Properties

- 'Point-like'
- luminous **non-stellar broad band spectra**- very broad range in luminosity  $\log L \sim 40-48$  ergs/sec
- located in center of *some* galaxies at any one time
  - but SMBHs exist in 'all' massive galaxies

## What Are Active Galactic Nuclei

*Radiating supermassive black holes in the centers of galaxies*

# HST Images of 4 Quasars (Bahcall et al 1995)

Raw image- spikes are due to diffraction

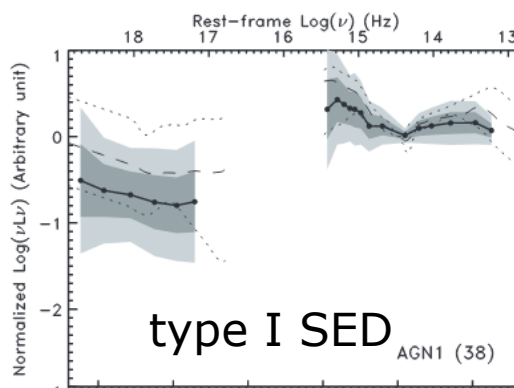

Point source subtracted

5

## Properties

- Optical spectra 3 classes
  - strong broad emission lines (type I)
  - strong narrow emission lines (type II)
  - strong non-thermal continuum (Blazars)
- radio ~10% of AGN show strong radio emission (jets/extended emission) due to synchrotron radiation (Blazars)

## What Are Active Galactic

*IR- emission reprocessed from optical-UV-soft x-ray via dust*

*Optical/UV- in most AGN due to accretion disk - variable*

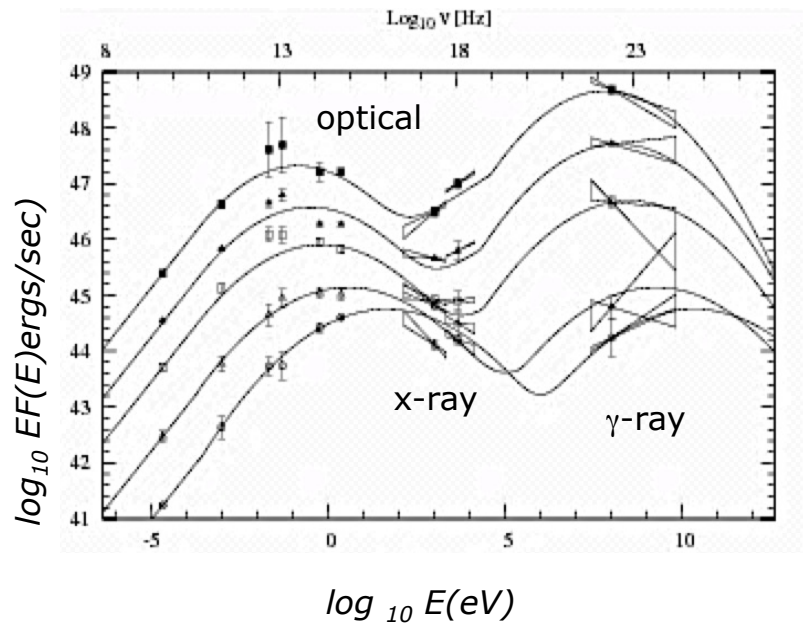

*Radiating supermassive black holes in the centers of galaxies*

*X-ray non-thermal power law spectra highly variable*

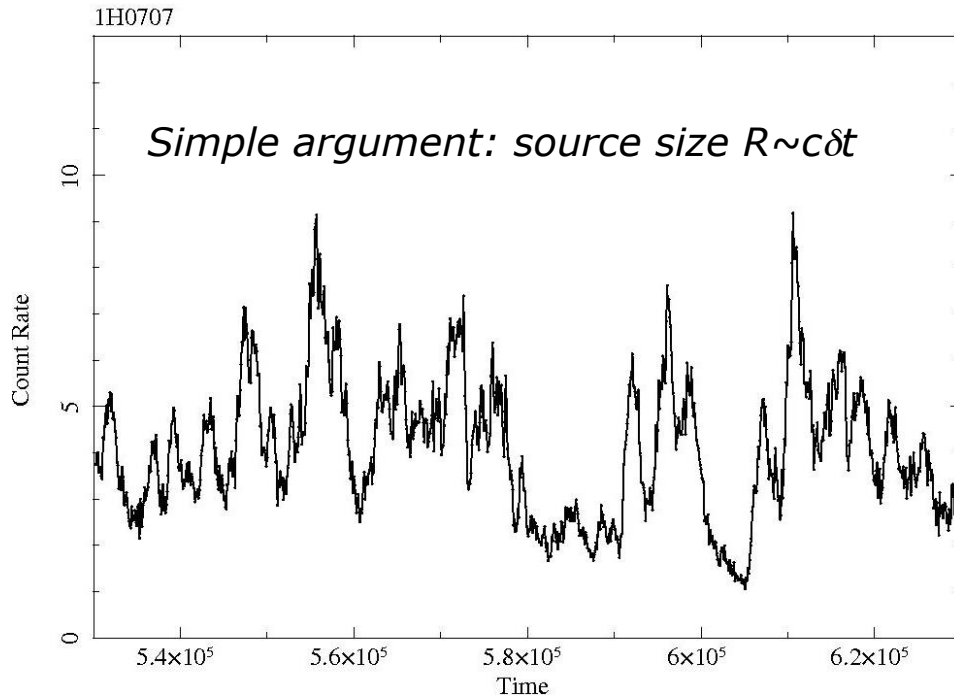

## Blazar SED

- Very broad, very different from Seyferts/quasars
- Much of the energy appears in the gamma-ray band

Rapid x-ray variability in AGN  
Luminosity  $\sim 5 \times 10^{43}$  ergs/sec

Kepler optical light curve of a Bl Lac Object  
(Blazar) W2R1926+42

# AGN Zoo

"Radio-loud" objects show jets and enormous lobes of relativistic plasma

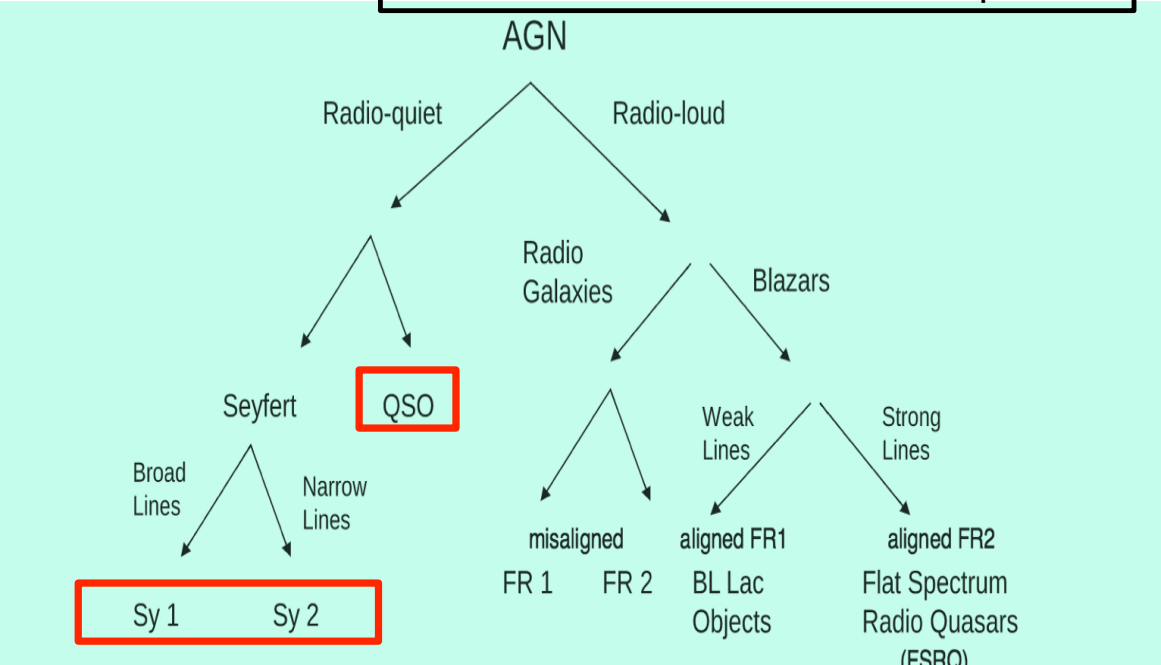

Figure 1. **Observational classification of active galaxies.** AGN are subdivided into classes depending on observational aspects, such as their radio loudness or the presence of optical lines in their spectra. QSO = quasi-stellar objects; Sy1 and Sy2 = Seyfert 1 and 2; FR1 and FR2 = Fanaroff-Riley 1 and 2.

## AGN Unification

### General comments

- AGN are diverse... they have a **vast range of properties**
- In general, there are three "axes" to consider...

### I Luminosity

- Range from  $<10^{40}$  erg/s to  $\sim 10^{48}$  erg/s
- Fundamental parameters controlling this are **mass** and **mass accretion rate**
- Powerful objects called quasars (historically, AGN found before host galaxy could be identified)
- **But geometry has a major role in observational appearance**

# AGN Unification

## General comments

### II Level of obscuration

- In some objects, can "see" all of the way down to the SMBH (depending on wavelength)
- In other objects, view at some wavelengths is blocked by obscuring material (some objects are blocked at most wavelengths)
- Level of obscuration connected to **viewing angle**

13

# AGN Unification

## General comments

### III Presence of powerful relativistic (radio) jets

- Radio-loud AGN : generate powerful jets, seen principally via synchrotron radiation in the radio band
  - also important in x-ray and  $\gamma$ -ray
- Radio-quiet AGN : lack powerful jets (often possess 'weak' jets)
- Fundamental parameter controlling jet production **unknown (maybe black hole spin; or magnetic field configuration)**

14

## Active Galactic Nucleus

*K. Murphy*

Not all AGN have visible jets

# The Overall Picture (Beckman and Shrader 2013)

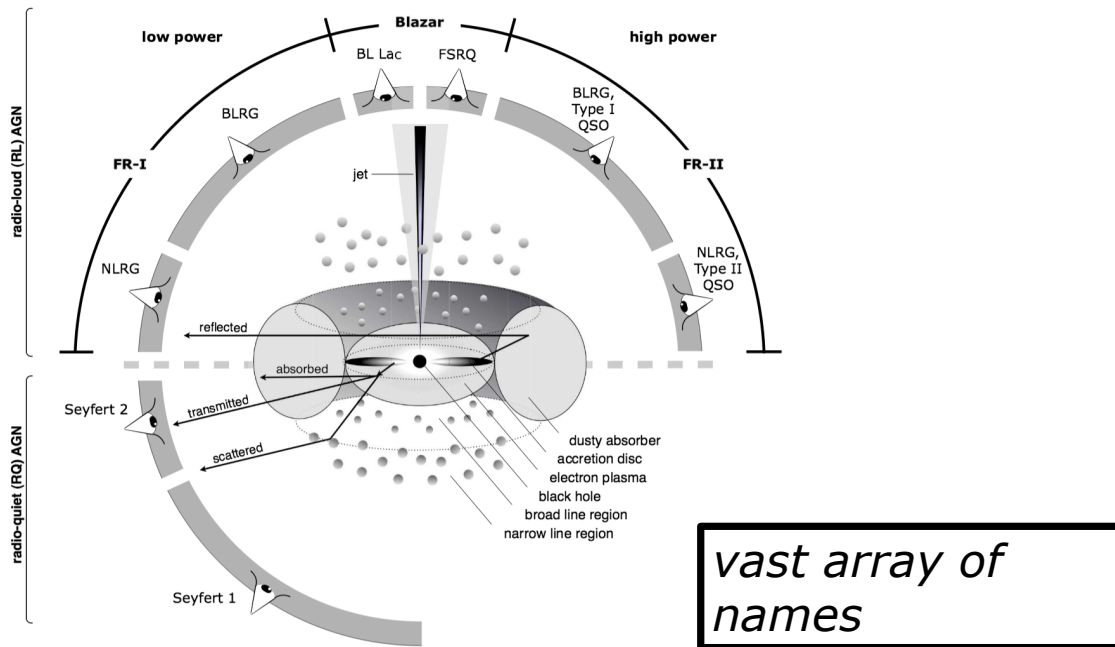

Figure 1: Schematic representation of our understanding of the AGN phenomenon in the unified scheme. The type of object we see depends on the viewing angle, whether or not the AGN produces a significant jet, and how powerful the central engine is. Note that radio loud objects are generally thought to be viewed face-on.

## AGN Zoo

In a simple unification scenario

- broad-lined (Type 1) AGN are viewed face-on
- narrow-lined (Type 2) AGN
  - the broad emission line region (BLER)
  - the soft X-rays
  - optical/UV emission from the AD
- are all "hidden" by dust and high columns of gas and viewed edge-on
- However there are other complications like jets and a range in the geometry

Radio Loudness	Optical Emission Line Properties		
	Type 2 (Narrow Line)	Type 1 (Broad Line)	Type 0 (Unusual)
Radio-quiet:	Seyfert 2	Seyfert 1 QSO	
Radio-loud:	FR I NLRG { FR II	BLRG SSRQ FSRQ	BL Lacs Blazars { (FSRQ)

Table 1: AGN Taxonomy: A Simplified Scheme.

*Radio Loudness*

*Optical Properties*

No Lines

Radio quiet (weak or no jet)	Type II (narrow forbidden lines) Seyfert 2	Type I (broad permitted lines) Seyfert 1 QSO	
Radio Loud (strong jet)	FR I NLRG FR II	BLRG	Bl Lac Blazars FSRQ
X-ray Properties	Highly Absorbed- strong narrow Fe K line, strong low E emission lines	Not absorbed- or ionized absorber often broad Fe K line- low energy spectrum with absorption lines	Featureless continuum- highly variable $\gamma$ -ray sources

19

table 27-2 Properties of Active Galactic Nuclei (AGNs)					
Object	Found in which type of galaxy	Strength of radio emission	Type of emission lines in spectrum	Luminosity	
				(watts)	(Milky Way Galaxy = 1)
Blazar	Elliptical	Strong	Weak (compared to synchrotron emission)	$10^{38}$ to $10^{42}$	10 to $10^5$
Radio-loud quasar	Elliptical	Strong	Broad	$10^{38}$ to $10^{42}$	10 to $10^5$
Radio galaxy	Elliptical	Strong	Narrow	$10^{36}$ to $10^{38}$	0.1 to 10
Radio-quiet quasar	Spiral or elliptical	Weak	Broad	$10^{38}$ to $10^{42}$	10 to $10^5$
Seyfert 1	Spiral	Weak	Broad	$10^{36}$ to $10^{38}$	0.1 to 10
Seyfert 2	Spiral	Weak	Narrow	$10^{36}$ to $10^{38}$	0.1 to 10

- Some of different classes of AGN are truly different ‘beasts’ - (e.g. radio loud vs radio quiet) but
- Much of the apparent differences are due to geometry/inclination effects- this is called the Unified Model for AGN (e.g. type I vs Type I radio quiet objects, blazars - radio loud objects observed down the jet)

(adapted from T. Treu)

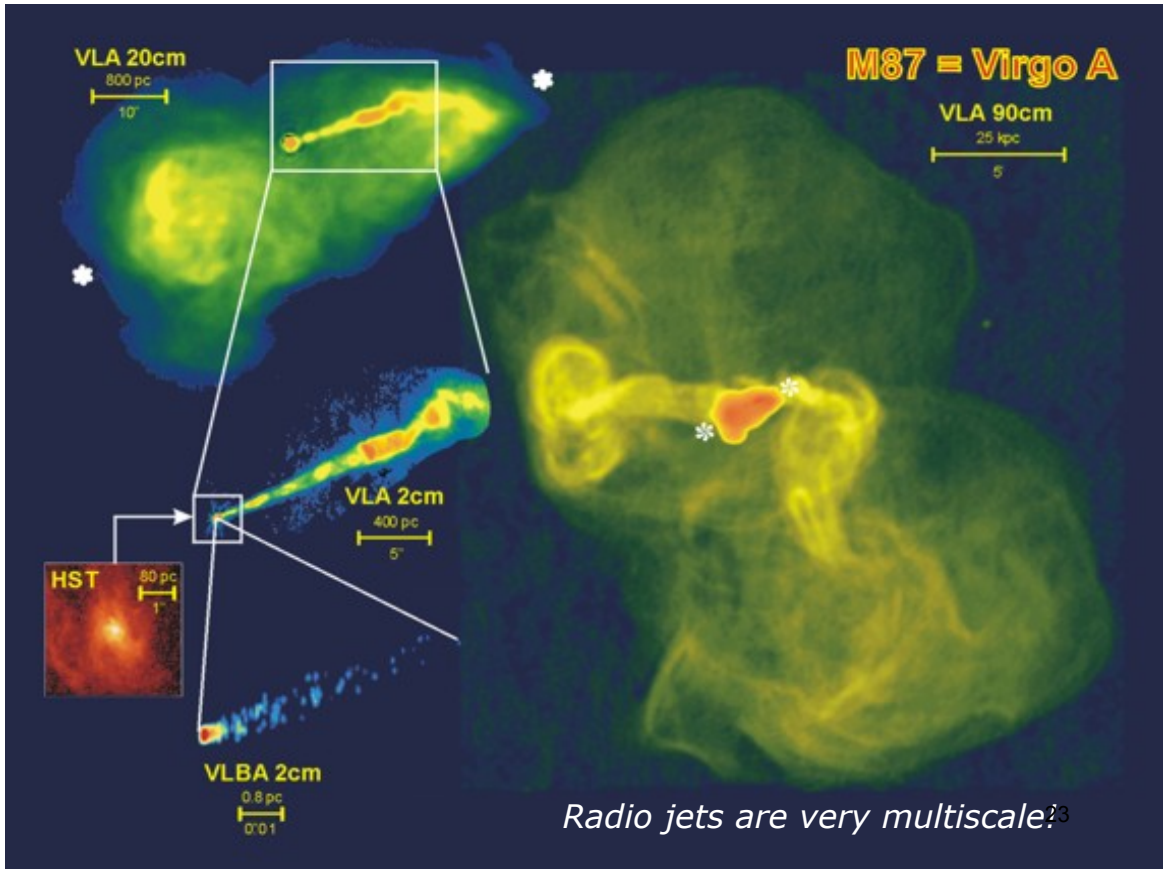

table 27-2 Properties of Active Galactic Nuclei (AGNs)					
Object	Found in which type of galaxy	Strength of radio emission	Type of emission lines in spectrum	Luminosity	
				(watts)	(Milky Way Galaxy = 1)
Blazar	Elliptical	Strong	Weak (compared to synchrotron emission)	$10^{38}$ to $10^{42}$	10 to $10^5$
Radio-loud quasar	Elliptical	Strong	Broad	$10^{38}$ to $10^{42}$	10 to $10^5$
Radio galaxy	Elliptical	Strong	Narrow	$10^{36}$ to $10^{38}$	0.1 to 10
Radio-quiet quasar	Spiral or elliptical	Weak	Broad	$10^{38}$ to $10^{42}$	10 to $10^5$
Seyfert 1	Spiral	Weak	Broad	$10^{36}$ to $10^{38}$	0.1 to 10
Seyfert 2	Spiral	Weak	Narrow	$10^{36}$ to $10^{38}$	0.1 to 10

The ingredients are:

- the black hole,
  - accretion disk,
  - the jet,
  - some orbiting dense clouds of gas close in (the broad line region),
  - plus a dusty torus that surrounds the inner disk
  - some less dense clouds of gas further out (the narrow line region)
- (adapted from T. Treu) 21

Hercules-A

*Pictor A: X-ray in blue, radio in red*

# Examples: Powerful quasar 3C273

25

## Broad Band Properties of AGN

- Broad band continuum- very different from stars or galaxies
- Strong UV lines not seen in stars
- Can be very variable

*Broad band spectral energy distribution (SED) of a 'blazar' (an active galaxy whose observed radiation is dominated by a relativistic jet 'coming at' us)*

*A large fraction of the total observed energy appears in the  $\gamma$ -ray band (due to relativistic beaming)*

## X-ray Selection of Active galaxies

- X-ray and optical image of a nearby AGN NGC4051-
- Note the very high contrast in the x-ray image
- Find x-ray AGN via
  - luminous\* pointlike x-ray source in nucleus of galaxy
  - hard x-ray spectrum
  - frequently variable

\* Have to distinguish from x-ray binaries located near nucleus

*Rosat x-ray all sky survey image overlaid on sky survey image*

## X-ray Selection of Active galaxies

- eRosita X-ray image of a nearby AGN H0707

## X-ray Selection of AGN

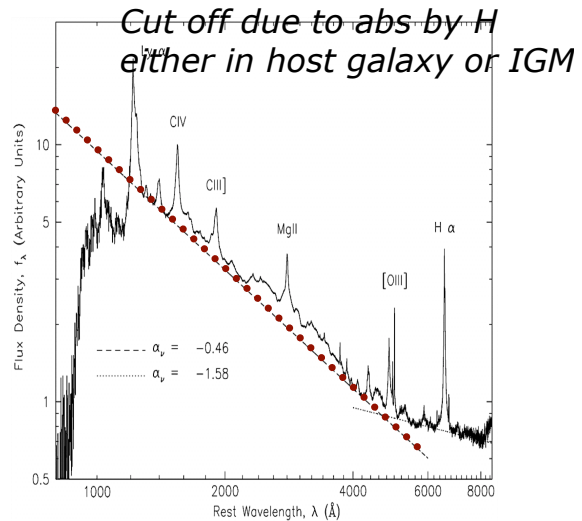

- Comparison of x-ray luminosity of AGN vs the total galaxy luminosity in a 'blind' x-ray survey
- AGN have  $\log L(x) \sim L(opt)$

Hasinger and Brandt ARAA 2005  
 color code is which observation the data were obtained from- **lines represent log of ratio of x-ray to optical flux**

## Optical Properties of AGN

- **Strong lines** of hydrogen, carbon, oxygen from highly ionized species ....

Unusual optical colors  
 (Richards et al SDSS)- quasars in *color*, stars are black

*UV-Optical Continuum is thought to arise via thermal emission in an accretion disk*

- AGN (type I) optical and UV spectra consist of a 'feature less continuum' with strong 'broad' lines superimposed

- Typical velocity widths ( $\sigma$ , the Gaussian dispersion) are  $\sim 2000-5000\text{km/sec}$

*Origin of  $\lambda > 4000\text{\AA}$  continuum not know*

- The broad range of ionization is due to the 'photoionization' of the gas- the gas is **not** in collisional equilibrium

- At short wavelengths the continuum is thought to be due to the accretion disk

*Origin of  $\lambda > 5000\text{\AA}$  continuum is complex*

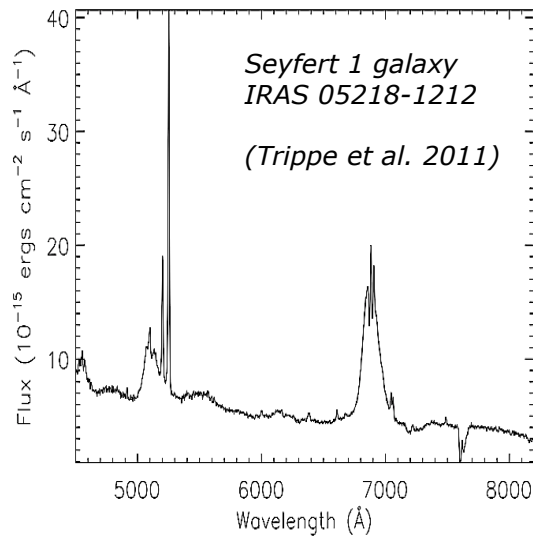

# AGN Unification

Broad line (type-1) objects

- **Blue optical/UV continuum**
- **Broad** optical/UV lines
  - Emission lines from permitted (not forbidden) transitions
  - Photoionized matter  $n > 10^9 \text{cm}^{-3}$
  - BLR lines  $\text{FWHM} \sim 2000\text{-}20000 \text{ km/s}$
- **Narrow** optical/UV lines
  - Emission lines from both permitted and forbidden transitions
  - $\text{FWHM} \sim 500 \text{ km/s}$
  - Sometimes spatially resolved  $0.1\text{-}1 \text{ kpc}$

■ **Overall spectrum reveals unabsorbed/unreddened nucleus**

33

## Seyfert I Composite Spectra (SDSS)

- Pol & Wadadekar 2016

UV-N

TABLE 2  
MEASURED EMISSION LINES

## AGN Unification Narrow line (type-2) objects

- Reddened Optical/UV continuum
- Emission line spectrum
  - "Full light" spectrum only shows narrow optical/UV lines
  - Broad optical/UV lines seen in **polarized light**... shows that there is a hidden broad line region **seen in scattered light** (Antonucci & Miller 1985)
- **X-ray spectrum usually reveals highly absorbed nucleus (NH > 10<sup>22</sup> cm<sup>-2</sup>)**

*type II **do not have broad lines and have a weak or absent 'non-stellar' continuum***

*Depending on the type of survey and luminosity range ~50% of all AGN are of type II*

# Seyfert II Optical/UV spectrum

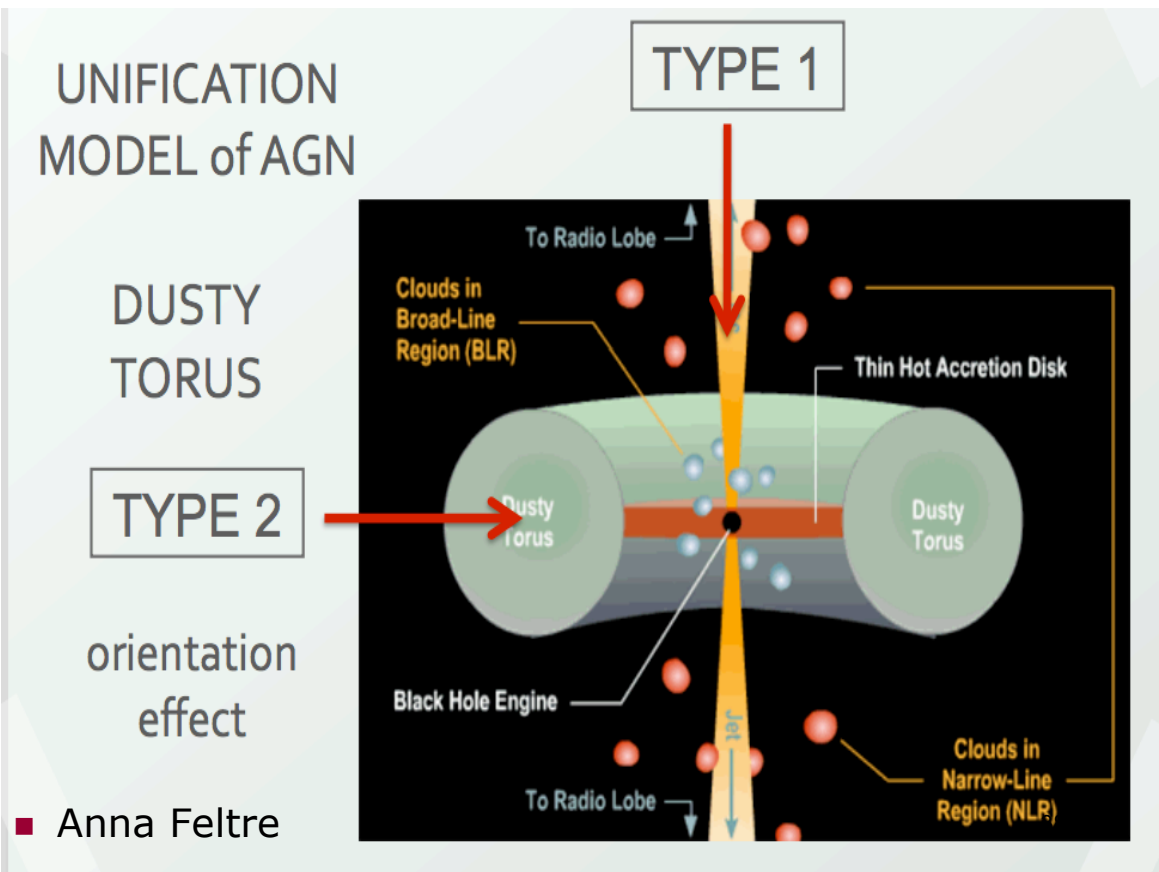

- Only narrow lines, weak UV spectrum

UV

optical
