

The Basic Structure of Present-Day Galaxies

1) Basic description of galaxy stellar 'components'

- bulge, disk, bars,

2) Parameter Relations in Galaxies

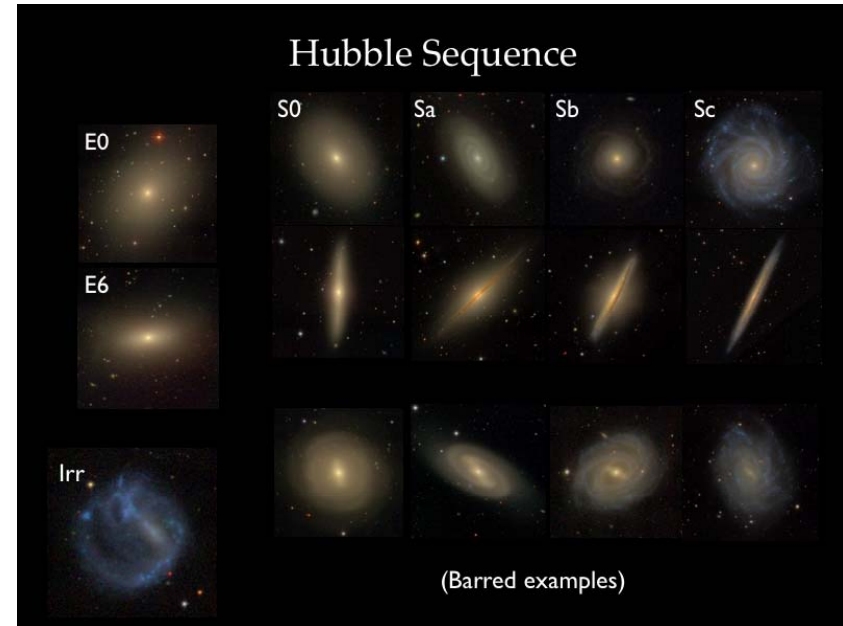

- Tully-Fisher, the 'Fundamental Plane' and the Kormendy relations
- Morphology, mass vs. kinematics
- Stellar mass vs. halo mass

3) Population properties

- Galaxy mass functions
- SFR functions
- Galaxy clustering

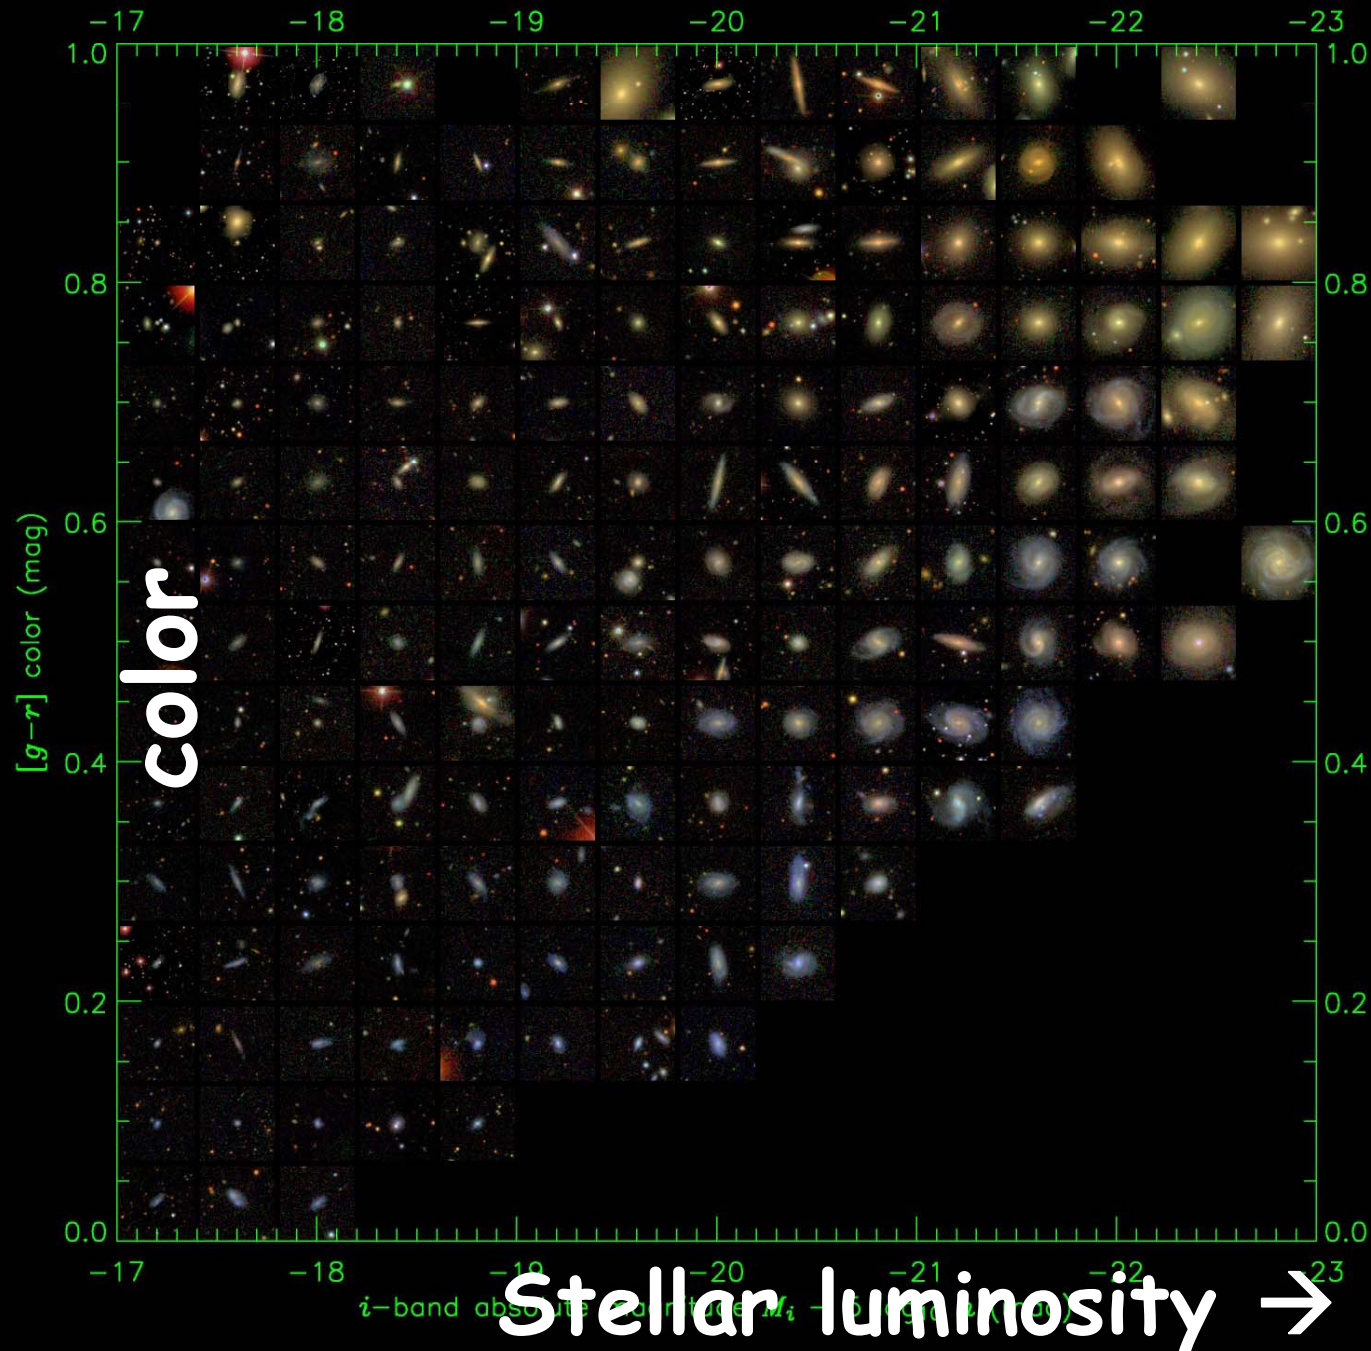

The present-day galaxy population

- How to describe galaxies?
- (Volume)-abundance of
 - galaxy masses
 - star formation rates
- Spatial clustering
 - correlation functions
 - Which galaxies in which halos?
- Parameter correlations
 - Tully-Fisher/Fund.Plane
 - SFR vs M_*
 - sizes, concentrations, shapes
 - stellar mass as a function of M_*

ssc2005-11a

Interacting/merging galaxies

Galaxy cluster Abell 1689 (HST)

Basic Description of the Stellar Distribution

- For fairly massive galaxies a basic two-component description of the stellar distribution proves useful:
 - Bulges/spheroids
 - Disks
- Radial profile description
Sersic (1968) profile

Disks: $n \sim 1$: 'exponential profile'

Spheroids : $n \sim 2 - 5$ ($n = 4$: 'de Vaucouleurs')

NB: $n_{\text{spheroid}} = f(L_{\text{spheroid}})$

Note: bulge/disk approach (3D shape & AE profile) not sensible for low-mass galaxies
